1.	Write the program for the following:	
1.1.	Create a program that asks the user to enter their name and their age. Print out a message	
	addressed to them that tells them the year that they will turn 100 years old	
1.2.	Enter the number from the user and depending on whether the number is even or

3.	Write the program for the following:
3.1.	A pangram is a sentence that contains all the letters of the English alphabet at least
	once, for example: The quick brown fox jumps over the lazy dog. Your task here is
	towrite a function to check a sentence to see if it is a pangram or not.
3.2.	Take a list, say for example this one:
	a = [1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89] and write a program that prints out all the

Implement the concept of inheritance using python
Create a class called Numbers, which has a single class attribute called
MULTIPLIER, and a constructor which takes the parameters $_{x}$ and $_{y}$ (these should all
be numbers).
i. Write a method called add which returns the sum of the attributes x and y . ii. Write a
class method called multiply, which takes a single number parameter a and returns
the product of a and MULTIPLIER.
Write a static method called subtract, which takes two number parameters, b andc,
and returns b - c.
Write a method called value which returns a tuple containing the values of x and y.

import your own module like this:
import geometry
Try and add print dir(geometry) to the file and run it.
Now write a function pointyShapeVolume(x, y, squareBase) that calculates the
volume of a square pyramid if squareBase is True and of a right circular cone if
squareBase is False. x is the length of an edge on a square if squareBase is True and
the radius of a circle when squareBase is False. y is the height of the object. First use

	squareBase to distinguish the cases. Use the circleArea and squareArea from the
	geometry module to calculate the base areas.
